1.0 Introduction

On Thursday, October 10, 2019, the United States Postal Service implemented the following software change:

- Package Platform Release 1.7.2.0

These Release Notes provide the contents of the release and affected subsystems.

The section titled **Corrections to Known Issues** is derived from External Trouble Reports (ETRs) and Engineering Change Requests (ECRs) for inclusion in this release.

This document is prepared based on the knowledge available at the time of its publication and any element may be subject to change prior to publication.

2.0 Package Platform - Corrections to Known Issues

2.1 Pricing Service

An issue was corrected to populate blank Stock-Keeping Unit (SKU) and Nearest Price values so that impacted packages could be priced using monthly average pricing. The blank SKU and Nearest Price values that were previously recorded for the impacted packages caused the monthly average pricing to fail for the packages. [724](#)

2.2 Reporting and Data Service

- The Package Platform reporting service implemented a maintenance procedure to load and reprocess data that failed to move files to the manifest error folder. This ensures that data from failed copy processes is available in the database. [744](#)
- In the additional details provided by the Package Platform data service, the ZIP Code field length was increased from 6 characters to 20 characters to accommodate international addresses used by mailers in their subscription preferences. [741](#)
- The Package Platform data service has been updated to resolve a timing conflict that previously prevented scan final notification message information from being populated. The issue occurred when separate processes attempted to populate validation data and scan final notification data for the same package record at the same time. Because of the conflict, the scan final notification data failed to populate. Final notification data for packages (records) impacted by the issue was also populated with this release. [731](#)
